# PREDICTION OF CENTRAL LOCATION OF THE STATE WITH IRREGULAR BOUNDARY 

*'T.A.O. SALAU AND ${ }^{2}$ A.E. ADELEKE<br>${ }^{1}$ Department of Mechanical Inginecring, University of Ibadan, Ibadan, Nigeria<br>${ }^{2}$ Department of Civil Engineering, Osun State University, Osogbo, P.M.B. 4494, Osogbo, Osun State, Nigeria<br>*Corresponding author: tao.salau@mail.ui.edu.ng Tel: +2348028644815

#### Abstract

Mathematics has diverse applications as decision making tool. This study investigated the use of a proposed pure mathematical formulation (i.e. excluding human factor) for citing appropriately the location of political capital city of an inhabited designated area. Digitized data of Scale map of Nigeria as a case study was used as input to a FORTRAN 90 programme codes of an equivalent least squares method mathematical formulation. The resulting simultaneous equations involving the political capital city coordinates as unknown variables were solved using Gauss Elimination Algorithm. The political capital city Cartesian coordinate prescribed as $(26,24)$ in grids unit for the studied case of scale map of Nigeria compared visually satisfactorily with Abuja location on the Map. The Nigeria land area cover was under-estimated by $2.3 \%$ referencing $923,768 \mathrm{sq} \mathrm{km}$ obtained from Microsoft Encarta Premium (2009). Similarly the Nigeria coastine was estimated as $25.3 \%$ of the country's estimated perimeter ( 3369 km ). This mathematical tool can be used to cite the centrally located capital city or capital city relocations economically, timely, accurately and reliably. This programme can also be used for citing of capital cities for other countries and center of any irregular shapes on two dimensional plane.

Keywords: Irregular Shape, Digitization, Mathematical tools, FORTRAN,

## INTRODUCTION

Mathematics plays several important roles in diverse disciplines including political decision making. It helps us not only to count votes, but also sheds light on the question of whether some voting and apportionment systems are fairer than others, Bennett and Briggs (2001).

For political reasons among others the acceptable mathematical statement that 12 2/3 approximated 13 during the petition proceeding of Nigeria 1979 Presidential election was a subject of post election hot debate, Reserved Judgements of the Supreme Court of Nigeria (1979). The inherent dan-
ger of not accepting this mathematical settlement is better imagined than witnessed. Nigeria may have been unable to move forward provided that the stalemate can be managed. Political stalemate of this nature may degenerate the nation to a war torn country.

Political office holders ruling group of people living together on designated land area herein referred to as "state" usually have their operating offices located at political capital city. The political capital city, not necessarily the economic state capital, is any location within the designated land area as agreeable to all state inhabitants' representatives.

A substitute circular boundary close to all
Generally, the state boundary used to be irregular. The irregularity coupled with political factors can make political capital city location tasking. Associated problems of political capital city location may discourage the creation of newer states and makes state slower development inevitable. Nigeria enjoyed newer states creation in 1939, 1963, 1967, 1976 and 1987 respectively, Jaiyesimi (2009). Although newer state creation is good for developmental purposes, the continued agitation for more new state creation in Nigeria in recent times remainced unimplemented. The reasons may not be more than political, among others.

The present study proposes a mathematical formulation that is capable of prescribing appropriate political capital city location using rigorous procedure and the Cartesian coordinates of the state irregular boundary.
points on the irregular boundary was sought. The centre of the circular boundary is the same as the political capital city location. This formilation procedure is analogous to finding best line of fit to experimental data using least squares method. Least squares linear regression method uses a rigorous mathematical procedure to find a line that is close to all the data points (Holtzapple and Dan Reece, 2003).

Purposely, all the state inhabitants living along the edge of the irregular state boundary are fairly considered for "equal" access distance to political city location in economic rate per kilometre travelled. Unbalanced consideration may lead to various agitations and tensed state.

Figure 1 refers:
Let the Cartesian coordinate of political capital city be represented as PCC ( $\mathrm{x}_{\mathrm{c}}, \mathrm{y}_{\mathrm{c}}$ ).
Let $P_{i}$ be an arbitrary point on the irregular boundary with Cartesian coordinate $\left(x_{i}, y_{i}\right)$. l.et R be the radius of a substitute circular boundary with centre at $\mathrm{PCC}\left(\mathrm{x}_{\mathrm{c}}, y_{c}\right)$. Let $G_{i}$ be the radii line that connects $P_{i}$ and $P C C$.

Then

$$
\begin{equation*}
G_{i}^{2}=\left(x_{i}-x_{c}\right)^{2}+\left(y_{i}-y_{c}\right)^{2} \tag{1}
\end{equation*}
$$

Expand the right hand side of equation (1) yields:

$$
\begin{equation*}
G^{2}=x_{i}^{2}+y_{i}^{2}+x_{c}^{2}+y_{i}^{2}-2 x_{i} x_{c}-2 y_{i} y_{c} \tag{2}
\end{equation*}
$$

Let error be;

$$
\begin{equation*}
\varepsilon_{i}=R^{2}-C_{r}^{2} \tag{3}
\end{equation*}
$$

## THEORY AND METHOD

Figure 1: Arbittary Designated Region Superimposed with Substitute Circle of radius (R)
Source: Senior Secondary Atlas, Balogun (2009).

Using equation (3) error square total will be:

$$
\begin{equation*}
\varepsilon_{T}^{2}=\sum_{i=1}^{i=N}\left(R^{2}-G_{i}^{2}\right)^{2} \tag{4}
\end{equation*}
$$

Where N is the number of point Pi used to represent the irregular state boundary. Use equation (2) in equation (4) and let $R_{،}$, be:

$$
\begin{equation*}
R_{b}=R^{2}-x_{c}^{2}-y_{c}^{2} \tag{5}
\end{equation*}
$$

The right hand side of equation (5) is now a function of 3 -unknown constants: Ro, $x_{c}$ and $y_{c}$.

To minimize error square total the following conditions must be satisfied:

$$
\begin{equation*}
\frac{\partial \varepsilon_{T}^{2}}{\partial R_{v}}=\frac{\partial \varepsilon_{T}^{2}}{\partial X_{c}}=\frac{\partial \varepsilon_{r}^{2}}{\partial y_{c}}=0 \tag{6}
\end{equation*}
$$

Implementation of equations (6) yields three (3) simultaneous equations in Ro, $x_{c}$ and $y_{c}$ as in equation (7).

$$
\left[\begin{array}{lll}
N & 2 \sum x_{i} & 2 \sum y_{i}  \tag{7}\\
\sum x_{i} & 2 \sum x_{i}^{2} & 2 \sum x_{i} y_{i} \\
\sum y_{i} & 2 \sum x_{i} y_{i} & 2 \sum y_{i}^{2}
\end{array}\right]\left\{\begin{array}{l}
R_{n} \\
x_{c} \\
y_{i}
\end{array}\right\}=\left\{\begin{array}{l}
\sum\left(x_{i}^{2}+y^{2}\right) \\
\sum\left(x_{i}^{3}+x_{i} y_{i}^{2}\right) \\
\sum\left(y_{i}^{3}+y_{i} x_{i}^{2}\right)
\end{array}\right\}
$$

Scale map of Nigeria was obtained from Senior Secondary Atlas, Balogun (2009) and digitized using 3.5 mm by 3.5 mm square grids photocopied on transparency at room temperature. The integer value Cartesian coordinates obtained with the grids (see Table 1) was used in equations (7) to yield equation (8). Equation (8) was solved using

Gauss Elimination method. Digitized data of Scale map of Nigeria as a case study was used as input to a FORTRAN 90 programme (Appendices 1 and 2) codes of an equivalent least squares method mathematical formulation.

## RESULTS AND DISCUSSION

Results for this study are presented in tables and figures as follows:
Table 1: Cartesian coordinates of the Digitized Scale map of Nigeria in Grids

$$
\left(\begin{array}{ccc}
186 & 9678 & 8914  \tag{8}\\
4839 & 350742 & 250648 \\
4457 & 250648 & 287138
\end{array}\right)\left\{\begin{array}{l}
R_{o} \\
x_{c} \\
y_{c}
\end{array}\right\}=\left\{\begin{array}{l}
318940 \\
11316627 \\
9926765
\end{array}\right\}
$$

Solving for the three unknown parameters in equation (8) yielded respectively $\mathrm{R}_{\mathrm{o}}=-804.21$ grids, $x_{c}=25.87$ grids, and $y_{c}=24.47$ grids. In addition using equation (5) yields best representative radius ( $\mathrm{R}=21.54$ grids)

Figure 2: Digitized Scale map of Nigeria

Referring to Table 1 and Figure 2 political ment. It is important to note that Abuja recapital city coordinate location (i.c. $(26,24)$ placed Lagos as the political capital of Nigein grids) prescribed fall to within the re- ria in 1991, a new city, built over a decade [5, gional location of Abuja by visual assess- 6] for 'equal access' to all Nigerians.

Figure 3: Digitized Scale Map of Nigeria Superimposed by Prescribed Circle of Radius 22 grids

Estimate of Land Area Cover and Boundary Perimeter
Best circle substitute for scale map of Nigeria refers. The circle radius was estimated as 21.54 grids. For a grid of size 3.5 mm the $21.54 \times 3.5=75.39 \mathrm{~mm}$ circle radius is 7.5 cm .

Referring to the scalc map of Nigeria 4.2 cm is equivalent to 300 km , therefore the circle
radius is

$$
\frac{7.5 \times 300}{4.2} \text { 日 } 536 \mathrm{~km}
$$

Thercfore true estimated land area cover of Nigeria at substitute circle radius of 536 km is

$$
\pi R^{2}=\pi \times 536 \times 536 \square 902931 \mathrm{sq} \mathrm{~km}
$$

In here $\pi=\frac{22}{7}$ and radius ( $R$ ) is 536 km . If 923768 sq km quoted land area cover of Nigeria in the Microsoft Encarta Premium (2009) is taken as standard the relative percentage under estimation error due to the present estimate is $2.3 \%$.

Similarly the estimated perimeter of scale map of Nigeria is

$$
2 \pi R=2 \times \pi \times 536 \approx 3369 \mathrm{~km}
$$

The coastline ( 853 km ) is therefore $25.3 \%$ of the estimated perimeter using the Microsoft Encarta Premium (2009) figure as standard.

## CONCLUSION

This study has shown that mathematics can help in taking good decision about political
capital city location or relocation economically, timely, accurately, and reliably. In addition developmental activities with its attendant challenges involving engineers will implicitly suffer little or no delay thereby broadening knowledge bank at a faster rate. It is recommended that this programme can be used for citing of a central capital city or for relocating an existing capital city to a central location.
